Effective science teaching requires creativity, imagination, and innovation. In light of concerns about American science literacy, scientists and educators have struggled to teach this discipline more effectively. *Science Teaching Reconsidered* provides undergraduate science educators with a path to understanding students, accommodating their individual differences, and helping them grasp the methods--and the wonder--of science. What impact does teaching style have? How do I plan a course curriculum? How do I make lectures, classes, and laboratories more effective? How can I tell what students are thinking? Why don't they understand? This handbook provides productive approaches to these and other questions. Written by scientists who are also educators, the handbook offers suggestions for having a greater impact in the classroom and provides resources for further research.

This is the most comprehensive catalog of educational technology. If you like the concepts of universal design for learning this book will bring you to the next level with technology. The book outlines the very best educational technology to reach special education students, diverse learners and engage all students in the learning process. There is a new generation of low-cost technology to help reach challenging students like never before. This gives teachers countless tools to include in your UDL toolbox and enhances your teaching.

This book, written by a philosopher interested in the problems of social science and scientific method, and a sociologist interested in the philosophy of science, presents a novel conception of how we should think about and carry out the scientific study of social life. This book combines an evaluation of different conceptions of the nature of science with an examination of important sociological theorists and frameworks. This second edition of the work was originally published in 1982.

Almost 117 million passengers flew on Europe's low cost airlines in 2006. This statistic would have seemed beyond belief in the mid-1980s when air transport was a heavily regulated sphere. This book examines the deregulation which has taken place since then and in particular looks at the single most important repercussion of the deregulation of Europe's skies - the rise of the low cost airline. Sean Barret has been involved in the debates surrounding this right from the start and is well placed to provide a scholarly study of the issue. The book spends much time looking at the success of Ryanair in this period - this provides the perfect case study given the dominant role that the company has taken up over recent years.

Data-driven discovery is revolutionizing the modeling, prediction, and control of complex systems. This textbook brings together machine learning, engineering mathematics, and mathematical physics to integrate modeling and control of dynamical systems with modern methods in data science. It highlights many of the recent advances in scientific computing that enable data-driven methods to be applied to a diverse range of complex systems, such as turbulence, the brain, climate, epidemiology, finance, robotics, and autonomy. Aimed at advanced undergraduate and beginning graduate students in the engineering and physical sciences, the text presents a range of topics and methods from introductory to state of the art.
