An anal fistula, or fistula-in-ano, is an abnormal connection between the anal canal and the skin around the anus. They are often the result of a previous or current peri-anal abscess, leaving a narrow tunnel behind. The fistula usually originates from the infected anal crypts internally and tracks to the peri-anal skin externally.

Prevention of inadvertent sphincter injury causing incontinence is an essential element of fistula surgery, and perhaps the most difficult to assess without significant experience. It should be noted that many fistulas require some sphincter division and that many transsphincteric fistulas can be safely treated by fistulotomy. Furthermore, many factors contribute to “how much muscle can be safely cut,” including preoperative sphincter function, patient age, sex, and fistula location.

A fistulectomy is a procedure that fully removes the fistulous tract. This increases the likelihood of damage to the sphincters and is therefore often not preferred. However, this may be necessary if there is a large amount of tissue that is blocking normal function, or if there is a high likelihood of recurrence.

## Fistulotomy vs Fistulectomy: What's the Difference ...

There is still no clear consensus about surgical treatment of anal fistulas. Fistulotomy or fistulectomy and primary sphincter reconstruction is still regarded with skepticism. The aim of this systematic review was to evaluate the evidence in the literature supporting the use of this technique in the treatment of complex anal fistulas.
