The goal of the DNA computing field is to create a device that can work independent of human involvement. Three years after Adleman's experiment, researchers at the University of Rochester developed logic gates made of DNA. Logic gates are a vital part of how your computer carries out functions that you command it to do.

DNA computing is the use of biomolecular components rather than standard artificial hardware (such as silicon chips) in computer technology. In place of traditional code (such as the common binary variety), DNA computing utilizes the four-character genetic alphabet, which consists of: A – Adenine; G – Guanine; C – Cytosine; T – Thymine

What is DNA Computing? - Definition from Techopedia

DNA computing technology is unlikely to replace conventional silicon computers. But within five to 10 years DNA-based computers could be tested for medical applications.

What Can DNA-Based Computers Do? | MIT Technology Review

DNA computing is an emerging branch of computing which uses DNA, biochemistry, and molecular biology hardware, instead of the traditional silicon-based computer technologies. Research and development in this area concerns theory, experiments, and applications of DNA computing. Although the field originally started with the demonstration of a computing application by Len Adleman in 1994, it has now been expanded to several other avenues such as the development of storage technologies, nanoscale i
