MGT580 Forecasting and Risk Assessment (8) This subject examines the identification, measurement and management of risk using multi-disciplinary techniques. The role of the decision maker and the role of decision making heuristics and bias are studied together with key qualitative and quantitative techniques used to model, measure and treat risk. The subsequent treatment of risk through risk retention, self insurance or the transfer and avoidance of risk is also examined.

Risk analysis has become an important discipline within the field of project management. It involves prioritizing risks and assessing each identified risk's probability of occurrence and potential impact, whether positive or negative. This paper explores both qualitative and quantitative risk analysis techniques applied to the environmental industry.

Incorporating Risk Assessment into Project Forecasting

Forecasting is an underestimated field of research in supply chain management. Recently advanced methods are coming into use. Initial results presented in this chapter are encouraging, but may require changes in policies for collaboration and transparency. In this chapter we explore advanced forecasting tools for decision support in supply chain scenarios and provide preliminary simulation results from their impact on demand amplification.

Uncertainty is difficult to manage but uncertainties can be converted into known risk as forecasting capabilities and data management improve. When risk is understood, it can be categorised, mitigated, managed, hedged or even avoided. Uncertainties require continual review to identify changing facts and circumstances that affect risk.

The five risk factors were tested on the model and analysed with sensitivity analysis. In the research, the internal rate of return and capital requirement are used to indicate the performance of cash flow. With data from actual projects, the forecasting capability of the model and impact on cash flow caused by the five uncertainties were studied.

Forecasting is often seen as the province of the statistician. The paper makes the point that forecasting and accounting are so much linked that one can say that forecasting is really a matter of accounting for the future. Risk analysis (for valuation) has been the province of 'asset pricing' in finance.

Risk-Based Forecasting and Planning Variables We use 24 questions from the survey to measure five individual components of risk- based forecasting and planning. The first two components capture the extent to which firms identify and assess risks and the extent to which quantitative methods are used to carry out these activities.

The aim of this research was to improve the quantitative support to project planning and control principally through the use of more accurate forecasting for which new techniques were developed. This study arose from the observation that in most cases construction project forecasts were based on a methodology (c.1980) which relied on the DHSS cumulative cubic cost model and network based risk analysis (PERT).
