Conservation biology

-Wikipedia

Biodiversity is the variety and variability of life on

Earth. Biodiversity is typically a measure of variation at the genetic, species, and ecosystem level.

Terrestrial biodiversity

Bookmark File

PDF Insect

is usually greater near the equator, which is the result of the warm climate and high primary productivity.

Biodiversity is not distributed evenly on Earth, and is richer in the tropics.

Ser.: Insect ...

Summary.

Approximately one third of all forest insect species are saproxylic, meaning they depend on dying or dead wood. In addition to their importance to biodiversity, many of these species provide key ecosystem services – including

Bookmark File

PDF Insect

the breakdown of woody debris and controlling pest populations.

Documented declines of saproxylic insect diversity from the intensively managed landscapes of Europe serve as a cautionary tale for land managers throughout the world.

Bookmark File

Saproxylic insects:
diversity, ecology, and
conservation ...

While biodiversity loss is a global problem, conserving habitat for species of insects is uncommon and generally of low priority, although there are exceptions. More commonly insect conservation occurs indirectly,

Bookmark File

PDF Insect

either through the setting aside of large portions of land using "wilderness preservation" as the motive, or through protection of "charismatic vertebrates".
