Abstract. Agensis of mandibular second premolar is reported to be 2.4–4.5%. The diagnosis can be set on at average 9 years of age. Early treatment in the form of extraction of the second primary molar and in some cases also the remaining three second premolars and comprehensive orthodontic treatment are often a good treatment solution.

Orthodontic management of maxillary lateral incisors agensis. The purpose of this article is to show the different modalities of treatment for upper lateral incisors agensis. In daily practice, orthodontists often meet cases of upper lateral incisors agensis. The two common treatment options are: space closure, using canines to substitute the missing lateral incisors, or space opening for future restorations.
