The project focuses on the stress analysis of a car frontal protection system (bumper) simulations. To achieve that, we go to basic concepts of improving the safety on the car by do analysis the car bumper. It is important to know their mechanical properties, how their failure mechanism during the impact. This analysis was carrying out by using commercial Finite Elements software (ALGOR) to ...

The Front Impact Analysis is done to find out the amount of bending stress as well as deformation generated in the FSAE chassis if the car hits a solid body from the front whereas it is more likely to happen in any worst case. In order to Simulate the frontal impact crash, the vehicle was assumed to impact upon a stationary object.

The current work contains the load cases & boundary conditions for the stress analysis of chassis using finite element analysis over ANSYS. Finite element model of the vehicle chassis is made. Abstract—The bumper bracket is a metal piece which connects the bumper to the reinforcement or frame. This paper describes the design and analysis approach used for the bumper bracket for car. Railway vehicle structures generally consist of shells, plates and beams, and behavior of these members directly affects static and dynamic structural behaviors of these vehicles. In this study, numerical results on stress, vibration and crash analyses of railway passenger and freight car structures made of steel members are presented. Finite element (FE) method is used to assess the static ...

Stress–strain analysis (or stress analysis) is an engineering discipline that uses many methods to determine the stresses and strains in materials and structures subjected to forces. In continuum mechanics, stress is a physical quantity that expresses the internal forces that neighboring particles of a continuous material exert on each other, while strain is the measure of the deformation of ...
